Arc.dev

Senior Workflow Automation Specialist

Dear Arc.dev Recruitment Team,

Most automation candidates understand the "how" of connecting APIs. I specialize in the "why" and the "what for" within high-stakes, regulated environments where technical failure has direct compliance and revenue consequences. I don't just build workflows; I architect unified intelligence layers that consolidate complex business logic into resilient, API-first environments.

I am a founder-led automation specialist with a track record of replacing fragmented, legacy manual stacks with agentic solutions. My flagship build is the ****Complete Care Marketing (CCM) platform****—an Enrollment Intelligence System I designed for the Medicare sector. I moved a team of 300 agents from an eleven-system manual workflow into a single unified API layer. This wasn't just a technical migration; it was a structural redesign that integrated Sunfire, MARX, EnrollHere, and several other platforms into a real-time conversational assistant.

The CCM platform uses agentic logic to monitor live calls, detect compliance risk, and fire verbatim guidance. By automating the data orchestration and compliance auditing, we reduced new hire training ramp by 80% (from 4 weeks to 3-5 days) and saved over \$160,000 per month in pure operational overhead. This is the level of technical impact I deliver—systems that aren't just "automated," but are strategically optimized for the core business outcome.

I'm applying through Arc.dev because I operate best in senior remote roles that require high accountability and the ability to bridge the gap between technical architecture and operational strategy. My stack centers on n8n (self-hosted and cloud), Make, REST API orchestration, and SQL (Supabase/Postgres), supplemented by LLM orchestration for non-linear decision support.

I own the technical lifecycle. From identifying the root cause of operational friction to architecting the API-first solution and verifying the long-term ROI, I approach every build with a founder's mindset. I want to bring this same level of technical precision and strategic accountability to your high-priority automation projects.

I would welcome the opportunity to discuss my work with the CCM platform and how my senior-level automation expertise aligns with the roles you are currently placing.

Sincerely,

Bryan Jaworski
