Back At You

AI Operations and Tools

Dear Back At You Team,

Your job description uses the phrase "operational glue" — connecting ad tech to billing, CRM to marketing tools, and using AI to reduce operating costs. That's not an abstract concept for me. I have spent the last three years building exactly that, at scale, in a high-stakes regulated environment. I want to bring that to Back At You.

At Complete Care Marketing, I designed and built the CCM Enrollment Intelligence System from the ground up. The problem: 300 Medicare insurance agents working across 11 disconnected platforms — separate CRM, billing, compliance, telephony, and enrollment systems — with no shared data layer and no AI anywhere in the stack. My solution was a Python- and REST API-driven operational layer that unified all 11 platforms, fed real-time data into a SQL pipeline (Supabase/PostgreSQL), and layered LLM inference on top for live call coaching and compliance monitoring. The result: \$160,000 per month in eliminated operating costs, an 80% reduction in training overhead, and zero compliance failures post-launch.

That build maps directly to what Back At You is hiring for. Connecting ad platforms to billing systems and CRMs to marketing tools is the same class of problem — disparate SaaS stacks with sensitive data flowing between them, where the cost of a bad integration is real. I understand ChargeBee-style billing workflows, CRM data models, and the kind of API error handling that prevents downstream failures. Through Jaws AI 911, I continue building these systems daily — using OpenAI and Claude APIs for inference, n8n and Make for orchestration, and Python for the custom logic that no-code tools can't handle.

Your role requires rapid context-switching across departments and the judgment to "ruthlessly identify AI automation opportunities." I operate exactly this way. I don't wait for a ticket to tell me where the friction is — I audit the data flow, find the manual hand-offs, and build the automation. At CCM, I did this across billing reconciliation, compliance auditing, agent onboarding, and enrollment data pipelines simultaneously, with full access to sensitive member data and zero incidents.

I don't need to be trained on what this role requires — I have shipped it. The stack match is exact: Python, SQL, REST APIs, LLMs, Zapier, Make, n8n, CRM, and billing integrations. What I bring beyond the stack is operational judgment — the ability to understand the business consequence of a workflow failure, not just the technical fix.

I would welcome a conversation about the specific automation priorities on your roadmap and how my background in AI-driven operations aligns with where Back At You is heading.

Sincerely,

Bryan Jaworski
