Cognigy

Solutions / Implementation Specialist

Dear Cognigy Team,

Enterprise contact centers don't need more "theory" about AI. They need systems that work on a live call, under the pressure of regulatory compliance and high-volume demand. I don't just talk about conversational AI; I build and implement the agentic layers that make it a reality for the workforce.

I spent five years in the Medicare insurance sector—managing teams of hundreds and wrestling with the "eleven-system stack" that defines modern healthcare operations. I arrived at implementation not from a computer science lab, but from the floor of the contact center. I learned to build because the tools I was given were failing my agents and our members.

The ****Complete Care Marketing (CCM) platform**** is my proof of concept for exactly what Cognigy delivers to the world's largest enterprises. I designed and implemented a unified intelligence layer that sits on top of existing CRMs and carrier portals. It uses agentic logic to monitor live conversations, detect compliance risk, and fire real-time verbatim guidance. The result was a structural elimination of non-compliant enrollments and a reduction in training ramp from 4 weeks to 3-5 days. For a 300-agent team, that saved over \$160,000 per month in pure operational overhead.

I'm applying to Cognigy because you are the recognized leader in enterprise conversational AI, and you need implementation specialists who can walk into a Fortune 500 company and not only speak the language of "low-code orchestration" but also demonstrate the deep operational empathy required to make a digital transformation stick. I know why agents resist new tools, I know where compliance breaks on a transfer, and I know how to build the workflows that solve both.

I own the implementation outcome. As a founder-led builder, I don't just deliver a spec and move on. I find the friction, design the automation, and verify the ROI. Cognigy's platform is the engine I want to use to help your clients transition from manual legacy processes to an AI-native operational future.

I would welcome the opportunity to discuss how my work with the CCM platform and my experience in high-stakes healthcare operations align with Cognigy's implementation goals.

Sincerely,

Bryan Jaworski
