Hiring Team

Designit — AI Automation Specialist

Dear Hiring Team,

Most organizations buy AI tools and hope their teams figure it out. The result is expensive software that sits underused while workflows stay manual. I take a different approach — I design automations that fit how teams already work, then make sure those systems actually get adopted. That combination is exactly what the AI Automation Specialist role at Designit is asking for, and it's what I've been doing for the past several years.

The clearest example of this is the Complete Care Marketing Enrollment Intelligence System — an AI platform I built from scratch for a 300-person contact center. The challenge wasn't just technical; it was getting a large, non-technical team to trust and rely on a new layer of AI every single day. I unified 11 separate platforms into one intelligent workflow, integrated real-time LLM coaching and compliance monitoring, and built the training materials that got new hires operational in 3–5 days instead of four weeks. The outcome: \$160,000 in monthly operational savings and zero compliance failures. That's what happens when automation is built for the people using it, not just for the proof-of-concept slide deck.

Through Jaws AI 911, I've continued this work with businesses across industries — analyzing where manual friction costs time and money, then building custom pipelines using tools like Make, n8n, and direct API integrations with ChatGPT and Claude. The engagements that succeed aren't the ones with the most sophisticated architecture; they're the ones where the team understands what the system is doing and why it helps them. I've found that training and support aren't afterthoughts — they're where adoption actually happens.

Designit's work at the intersection of design thinking and enterprise transformation is a natural home for this kind of practice. The Microsoft Cloud Marketing, Blog, and Social team isn't just running campaigns — it's generating content, analyzing performance, and iterating fast. AI automation applied thoughtfully to that environment can compound the team's output without adding headcount. I'm comfortable working at that intersection: understanding what a marketing team needs, then building the systems and workflows that deliver it reliably.

I don't just deploy AI — I make it useful. Whether that means building a new workflow, integrating an AI tool with an existing platform, or running a training session that turns skeptics into advocates, I stay engaged until the system is actually working for the people it was built for. I'd love to bring that approach to Designit and the teams you support.

I would welcome the opportunity to talk through my work and how it connects to what you're building at Designit.

Sincerely,

Bryan Jaworski
