Huzzle

AI & Automation Specialist

Dear Huzzle Team,

I run Jaws AI 911, an automation consulting practice where I design and deploy workflow systems for founders and operations teams using n8n, Make, Zapier, REST APIs, Supabase, and LLM orchestration. I work with clients to map their processes, identify where automation creates the most leverage, and then build systems that actually get used — not just technically functional, but clean enough that the team can operate them without me on speed dial. That work is ongoing and it is exactly what the AI & Automation Specialist role at Huzzle describes.

The largest system I've built to date is the CCM Enrollment Intelligence System — a custom AI platform I designed for a 300-agent Medicare contact center. The problem was that agents were managing eleven separate platforms simultaneously on every call: enrollment systems, CRM, carrier portals, compliance tools, medication lookup, coaching references. The cognitive overhead was destroying productivity and creating compliance risk. I built a unified automation layer that connected all eleven systems via REST APIs and custom workflow integrations, surfaced everything in a single interface, and added a real-time compliance engine and LLM-powered live call coaching layer on top. Three hundred users. Zero compliance failures post-launch. \$160,000 per month in operational savings. That's what happens when you solve the right problem at the systems level rather than patching around it.

The pattern I follow on every engagement is the same one Huzzle needs from this role: start with a real discovery conversation to understand what people actually do day to day, not what the process doc says they do. Map where the friction is. Identify which automations deliver ROI versus which ones just move work around. Build the simplest system that solves the actual problem. Document it clearly. Make sure the team can own it. Huzzle is a platform where the quality of internal operations and client success processes directly affects the match experience — that's a real stakes environment, not a playground, and I've built in environments like that before.

On the tooling side: I work in GoHighLevel as a CRM and automation backbone in several client engagements — it maps cleanly to the automation work I do in n8n and Make. I'm comfortable building multi-step workflows with conditional logic, API integrations, webhook triggers, and database backends in Supabase/PostgreSQL. I use Claude and OpenAI APIs to add reasoning and language capability into automation flows where a simple if-then isn't enough. I write Python and JavaScript when the no-code layer hits its limits.

I'd like to talk about what Huzzle's current automation gaps look like and where the highest-leverage builds are. Happy to walk through specific systems I've built, discuss architecture decisions, or get into the weeds on any of the tooling you're already using.

Sincerely,

Bryan Jaworski
