Music.ai

Operations / Product Success

Dear Music.ai Team,

Most candidates for AI operations roles come from either a pure tech background or a pure business background. I arrived here from two disparate but equally demanding worlds: high-stakes healthcare operations and professional guitar performance. I don't just understand the data structures of AI; I understand the creative soul of the medium it is transforming.

I am a professional guitarist with a deep respect for the craft, and a founder-led operations expert with a track record of building unified intelligence layers for complex industries. Over the last year, I've logged more than 1,000 hours of R&D in AI systems, focusing on how agentic workflows can replace manual friction in both technical builds and creative content pipelines.

My most significant build is the ****Complete Care Marketing (CCM) platform****—an Enrollment Intelligence System I designed for the Medicare sector. I moved a team of 300 agents from an eleven-system manual stack into a single unified API layer. This system used agentic logic to monitor live calls, detect compliance risk, and fire verbatim guidance. It reduced training ramp by 80% and saved over \$160,000 per month in operational overhead. This is the level of analytical precision I bring to the table—the ability to take a non-linear, high-stakes environment and architect a system that makes excellence structural.

I'm applying to Music.ai because you are at the intersection of professional-grade audio and advanced AI. You need people who can bridge the gap between "the algorithm" and "the artist." I speak both languages. I know what a session player needs from a tool, and I know how to build the operational workflows that ensure a product like yours performs at a "Medicare-grade" standard of reliability and compliance.

I own the creative-technical intersection. Whether I'm authoring AI-assisted build documentation for EV platforms or designing automated content pipelines for my own businesses, I focus on the outcome. I want to bring my combination of operational rigor and musical intuition to help Music.ai build the future of the industry.

I would welcome the opportunity to discuss how my background in AI systems and professional music can drive value for your team.

Sincerely,

Bryan Jaworski
