Ryz Labs

Music Specialist — AI Trainer

Dear Ryz Labs Team,

Training an AI model to understand music requires more than just a theoretical knowledge of theory; it requires a combination of creative intuition and extreme analytical precision. I bring both. I am a professional guitarist with a deep understanding of musical nuance, and an operations expert who has managed high-stakes data integrity in the Medicare sector.

I understand the level of detail required for effective AI training. Over the last year, I've logged more than 1,000 hours of R&D in AI systems, focusing on agentic workflows and creative content generation. My professional background is centered on maintaining 100% precision in regulated environments. At TailorMade Insurance Group, I designed QA protocols for high-volume teams where a single data error could have major compliance consequences. I bring that same "Medicare-grade" precision to everything I build or train.

My work with the ****Complete Care Marketing (CCM) platform****—an Enrollment Intelligence System I designed—is my proof of concept for structured AI guidance. I built a system that provides real-time verbatim guidance to agents based on live call analysis. Training that system required the ability to take complex, non-linear human interactions and translate them into a structured intelligence layer that performed correctly on every call. I reduced training ramp by 80% and structurally eliminated non-compliant outcomes. This is the level of rigor I want to bring to Ryz Labs' music training projects.

I'm applying for the Music Specialist — AI Trainer role because I want to help bridge the gap between human artistry and machine learning. I can analyze a piece of music with the ear of a professional player and label that data with the precision of a senior operations manager. I am comfortable working in remote, async environments and I own the quality of every output I produce.

I own the training precision. Whether I'm authoring AI-assisted technical build documentation or labeling complex musical data, I focus on the accuracy of the underlying model. I want to bring my combination of musical expertise and operational rigor to help Ryz Labs build the future of AI-driven audio.

I would welcome the opportunity to discuss how my background in professional music and high-stakes operations can drive results for your training team.

Sincerely,

Bryan Jaworski
