## phData

Senior Consultant, AI Adoption & Change Management

Dear phData Hiring Team,

Change management for AI transformations is a discipline most firms describe well and execute poorly. The gap between a change assessment deck and a 300-person team actually adopting a new system is where most programs fail — and where I've spent the last few years operating. I didn't consult on an AI adoption. I designed, built, and ran one end to end in a high-stakes regulated industry, and I'm still in the work today through my active consulting practice.

At Complete Care Marketing, I took a 300-agent Medicare contact center operating on eleven fragmented platforms and led a full AI transformation — from current-state discovery through post-go-live sustainment. The technical deliverable was the CCM Enrollment Intelligence System, which unified those eleven platforms into a single intelligent layer. But the real deliverable was adoption. That meant mapping people impacts by role, designing a communication strategy that got skeptical agents to stop seeing the new system as a threat to their autonomy, building peer champion networks in each team pod, and iterating fast on friction points before they became resistance events. The system went live. Nobody asked to go back.

The outcomes were measurable: new-hire onboarding ramp dropped from four weeks to three to five days — an 80% reduction. Monthly operational savings exceeded \$160,000. Compliance failures dropped to zero — not because we trained harder on protocol, but because we redesigned the workflow to make non-compliant actions structurally impossible. That's the difference between change management as a communication exercise and change management as transformation architecture.

**phData's clients hire you because they need AI and data investments to actually land in their organizations.** That's not a technical problem — it's a people problem with a technical dimension. I understand both sides, which is less common than it should be. Most change practitioners I've worked alongside understand organizations but struggle to speak fluently about what the technology actually does. I can facilitate a discovery session with business stakeholders in the morning and have a working automation prototype by end of day. That range is what lets me translate accurately in both directions.

Through Jaws AI 911, I currently work with founders and business operators to design and deploy AI workflow systems — which means I'm doing active consulting work while applying here, not dusting off skills from a prior role. I understand the cadence of client engagements, the discipline of scoping, and the reality that clients need to see adoption outcomes, not just a system that technically works.

I'd welcome the opportunity to speak with your team about what a change program for an AI transformation actually looks like when it's built to hold — and how my background maps to the engagements phData runs for its clients.

Sincerely,

**Bryan Jaworski**
